

Addendum

**Figure 1.** Risk to general public from new unknown hazards transported through Europe's infrastructure of highways, railways and waterways, has emerged with the global production, new technologies, and distribution of products. This leads to the need for new diagnostic approach -detecti-on-management systems, risk communication and risk management planning and prevention. Goods produced in low income countries are often treated with pesticides leading to health problems for employees and consumers. Distribution centres transfer unopened transport units (with raw materials, production parts or products) from a seaport to millions of inland destinations throughout Europe. There is also an increasing transport of e-waste to the recycling centres in Europe comprising new health risks from old hazards.

**Fig. 2** The integrative approach for exposure assessment, diagnosis and risk communication with joint access to standardized methods, patient cohorts and bio banks is a part of the DiMoPEX philosophy

## Addendum
